

# Climate change: simple facts

**The climate change narrative is a pack of lies to promote global, corporatist interests and control nations. A concise summary of facts.**

## **Carbon Dioxide**

Is not to be feared. It is a vital molecule that gives life to the planet. Without it everything dies. The more CO<sub>2</sub>, the more green the planet. We have far lower levels of atmospheric CO<sub>2</sub> (around 450ppm) than in previous millennia (around 4-7,000ppm) and need more.

A 300ppm increase in CO<sub>2</sub> produces a 46% increase in plant bulk. A 155ppm increase in CO<sub>2</sub> improved rice grain yield from 16.9 to 26.1% (depending on nitrogen supply). [Twitter, Craig Idso, @co2science, 27 July 2019.]

Man produces very little CO<sub>2</sub> compared to nature. Termites provide more CO<sub>2</sub> and methane than mankind – 50 billion tons per annum. This is 10 times more than the present world production of CO<sub>2</sub> from burning fossil fuel. Animal flatulence provides more greenhouse gases (methane) than mankind. The rainforests (e.g. Amazon, Africa) provide more CO<sub>2</sub> than mankind. One volcano eruption produces more Greenhouse gases than all human history. [Dr Dixie Lee Ray, 'Trashing the Planet: How science can help us deal with acid rain, depletion of the Ozone, and nuclear waste', Blackstone Audiobooks, November 2011]

## **Global temperature**

Is very difficult to determine since local areas vary so much. What is certain is that it is not getting warmer. Temperature has been roughly stable for between 15 and 25 years depending on the sources. By some measures it has been declining for seven years. It was very much warmer in the late 19<sup>th</sup> century when birds dropped dead out of the sky. It was more than twice as hot in the late 1930s. It was slightly hotter in the late 1950s and significantly hotter in 1900. It was far warmer in the Medieval Warm period, a time of prosperity. It was still warmer in the Roman period when grapes were grown in York. [Roy Spencer PhD, Global warming, latest global temperatures.]

## **Environment**

### *Wildfires*

The number of wildfires has not dramatically increased. Most fires are caused by humans; either accidentally or deliberately. As many as 90% of US wildland fires are caused by people. [Insurance Information, 'Facts + statistics: wildfires'. National Interagency Fire Centre, Year-to-date statistics, 9 October 2019.]

## **Weather**

### *Hurricanes*

Atlantic hurricanes have not dramatically increased in number. [Stormfax Weather Almanac, Atlantic hurricane numbers by year: 1851-2017. Thomas Knutson et. al. Bulletin of the American Meteorological Society, 'Global TC and Hurricane frequency', and 'Global TC landfalls (1970-2017)', 12 June 2019.]

## **Oceanic sea levels**

80% of the tidal measurements show less than normal global average rises or even no rise at all. There is no evidence of acceleration. [PSMSL (Permanent Service for Mean Sea Level), Alameda (Naval Air Station).]

### *Acidic oceans*

Man-made CO<sub>2</sub> is not gradually turning the oceans into acid as surface ocean pH increases. The oceans are underlain by alkali rock called basalt. This rock balances the pH of the waters. If a lot of acid entered the oceans, it would react with the basalt rock and be neutralised. The big factor in sea pH is the base rock, not the atmospheric content.

### **Ice packs**

#### *The Arctic*

Greenland is not getting hotter and its glaciers are not melting very fast, threatening ocean rises. The temperature charts for SW Greenland, with the exception of 2012, are not different to those in the 1920s to the 1940s. There is no evidence that Greenland's climate is getting warmer. It simply goes through slightly warm phases in a cycle. Data shows that there was much less ice in the Arctic between 1972-1975. This week cargo ships got stuck in the Arctic because the weather got much colder much sooner than normal. [Not a lot of people know that, 'Latest fake claims about Greenland ice loss', 22 January 2019. IPCC report based on NOAA; Observed Climate Variation and Change, Fig 7.20.]

#### *Antarctica*

The sea ice in Antarctica is not disappearing but has expanded. Antarctica has also recently recorded its coldest winter since records began. [Reuters, 'Fact Check, six months of record cold temperatures at the South Pole Amundsen-Scott station does not discredit climate change'. NASA, 7 October 2014, 'Antarctic sea ice reaches new record maximum'.]

### **Tropical Islands**

#### *The Maldives*

Claims in the past that The Maldives was under threat by flooding by 2000 were utter lies. The islands have expanded and the population grown.

#### *The Marshall Islands*

Also grew in size.

#### *Tuvalu*

The doom predicted for Tuvalu was a lie. The islands grew in size from 1971 to 2014. Further studies showed that growth continued up to 2018. [Auckland University study by Professor Paul S Kench, Murray R Ford & Susan D Owen, 'Patterns of island change and persistence offer alternative adaptation pathways for atoll nations', published in Nature Communications, volume 9, Art. 605 (2018). Daily Mail, 'Sinking' Pacific nation Tuvalu is actually getting bigger, new research reveals', 9 February 2018.]

### *Coral reefs*

Claims that coral reefs are being destroyed are lies. Some, like the Great Coral Reef, have even expanded. [Sky News, Opinion, 'Peter Ridd (marine physicist): the idea coral reefs are close to extinction is completely ridiculous'.]

### **Animal extinction**

#### *Polar bears*

Polar bear numbers are not declining; they are prospering. Some ecologists believe that there needs to be a cull because there are too many bears for the food sources. [Climate at a Glance, Polar Bears. Polar Bear Science, 19 November 2014, 'Polar bear researchers knew S Beaufort population continued to increase up to 2012'.]

#### *Walrus*

Walrus are not stupid. They do not leap over cliffs to commit suicide due to global warming. Those that claimed this lied; Netflix (and David Attenborough) in 2019 faked this news. The reason is that they were fleeing polar bears and fell in panic. Independent

filmmakers filmed this polar bear attack occurring. [YouTube, Net Zero Watch, 'New footage reveals Netflix faked walrus climate deaths'.]

### *Penguins*

Penguins are not going extinct. Their numbers are expanding in Antarctica. [Scientific Reports, 'Multi-model survey of Adelie penguin mega-colonies reveals the Danger Islands as a seabird hotspot', 2 March 2018.]

## **Proposed solutions**

### *Biomass pellets*

These are pellets of wood formed by destroying ancient trees in Virginia forests, processing them in large factories and transporting them across the Atlantic to be burned in British power stations. This is claimed to be sustainable. In fact the whole process results in higher CO<sub>2</sub> emissions than if we burned coal. How can killing trees be Green?

### *Eradicating coal-fired power plants*

This is economic suicide for Britain, which has large reserves of local coal but otherwise must import fuel from unstable sources and routes. In fact, modern technology uses filtration systems which eradicate most of the CO<sub>2</sub> emissions from coal-fired power plants. We could be self-sustaining in energy supply and Green.

### *Hydrogen*

Various systems using hydrogen to replace fossil fuels have been proposed. However, the by-product of this is water vapour, which is a bigger Greenhouse gas than CO<sub>2</sub>.

### *Heat pumps*

The government wants us to get rid of gas and oil-powered central heating systems and replace them with heat pumps. These will cost £10-20,000 to fit. When installed, they take 24-hours to get up to heat and only heat to a temperature of 19 degrees C.

### *Solar power*

Domestic solar panels rarely work effectively and many suppliers have gone out of business. Most solar panels on people's houses are inefficient. Less than 14% of the energy that reaches them will be converted to electricity. Solar power only works effectively if there is enough sunlight, and this is rarely practical in Britain. Some areas where there are solar farms only have the required sunlight 10% of the time. [E.g. MRC News Busters, 'USA Today finds home solar panels not cost-effective', 15 August 2013. Northwestern University, Power System, 'How efficient are solar panels'. MRC News Busters, 'USA Today finds home solar panels not cost-effective', 15 August 2013.]

### *Wind turbines*

A wind turbine occupies 50 acres of land, takes 900 tons of steel and 2,500 tons of concrete and millions of these are required by Green policies, one turbine kills thousands of bats, birds and insects, as well as damaging peat bogs. Worse, the birds that are killed include many rare protected species, such as eagles, while turbines kill a million bats every year. The steel requires iron ore and carbon heated to very high temperatures only achievable through burning gas or coal. This also means digging up vast swathes of earth for mining. Inland wind sites have an effective capacity of only 10% of what is claimed. The 2,400 turbines in Britain at the moment only provide 1.3% of our national needs, less than the output of even one medium conventional power station. They provide nothing when there is no wind. Wind farm turbines cost twice as much to provide energy as normal power stations. Customer electricity bills are greatly inflated by Green policies; Green strategies hurt the poor the most. [See photos of dead birds at the foot of the wind farm at Ingbirchworth, West Yorkshire, Daily Mail, 'Why the £250bn wind power industry could be the greatest scam of our age ....', 28 February 2011. YouTube, Thoughty2, 'Renewable energy is a scam', 4 August 2019.]

### *Electric cars*

These create 70% more CO<sub>2</sub> emissions in manufacture than a diesel car. They are extremely expensive to purchase and have limited travel range. It is impossible to use electric HGV lorries to transport food and goods; the electric batteries cannot supply enough power. The batteries require child slavery in Third World mines to extract cobalt and lithium. It is impossible to provide enough of these minerals to power all the cars in the world. Disposing of the batteries is an environmental nightmare. Also the cars require new batteries every few years and each one costs £20,000.

### **Propaganda**

#### *Doom-mongers*

Every past prediction of global doom with ten years, or similar, such as by Prince Charles, has been proved to be a lie. This has been stated since the 1970s and the apocalypse never happened. [E.g. 'Civilisation will end within 15 or 30 years unless immediate action is taken against problems facing mankind', George Wald, Harvard Biology, 1970. 'It is already too late to avoid mass starvation', Denis Hayes, Chief organiser for Earth Day 1970.]

#### *Computer simulations*

The computer models used by the IPCC are utterly flawed, based on bad data and wrong assumptions and have proven to be false in their claims. The climate change scientists cannot predict even seasonal temperatures. Comparisons with actual observed data show that computer predictions utterly failed in every case. They cannot predict a seasonal cycle. [Song et. al. (2009) Nature vol. 457, 435-440.]

#### *Scientific consensus*

It is a lie to affirm that 97% of published papers agree global warming is happening and mankind is the cause. Researchers found that only 0.3% of 11,944 abstracts and 1.6% of the smaller sample endorsed man-made climate change since 1950. [Legates DR, Soon W, Briggs WM et. al. (2015), 'Climate consensus and misinformation: a rejoinder to Agnotology, scientific consensus and the teaching and learning of climate change'. Sci Edu. 24:299-318, doi: 10.1007/s11191-013-9647-9.]

### **The reason**

The real purpose of climate change strategies is corporate greed and the UN sustainability Agenda 2030. Billions are being made from corporate interests in combating global warming by companies that create pollution and harm the ecological system. The UN agenda is all about creating a global dominion ruled by the rich 1%, depopulation, and establishing a new serfdom concentrated in cities based on technocracy. It is evil.
